

# Workshop 9.2a: Nested designs

Murray Logan

23 Nov 2016

# Section 1

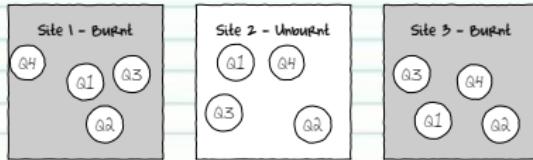

Nested designs

# Nested design

Simple

Nested

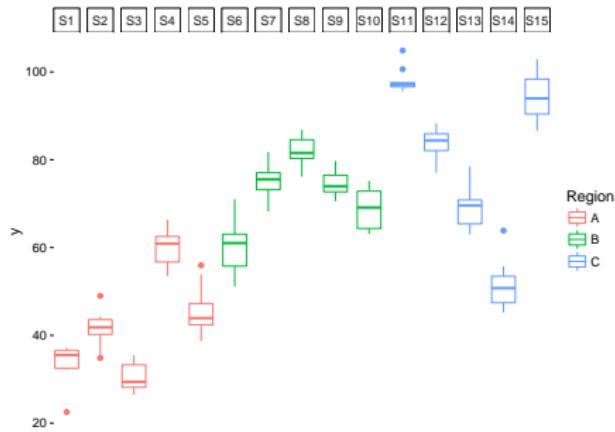

# Nested design

```
> data.nest <- read.csv('..../data/data.nest.csv')  
> head(data.nest)
```

	y	Region	Sites	Quads
1	32.25789	A	S1	1
2	32.40160	A	S1	2
3	37.20174	A	S1	3
4	36.58866	A	S1	4
5	35.45206	A	S1	5
6	37.07744	A	S1	6

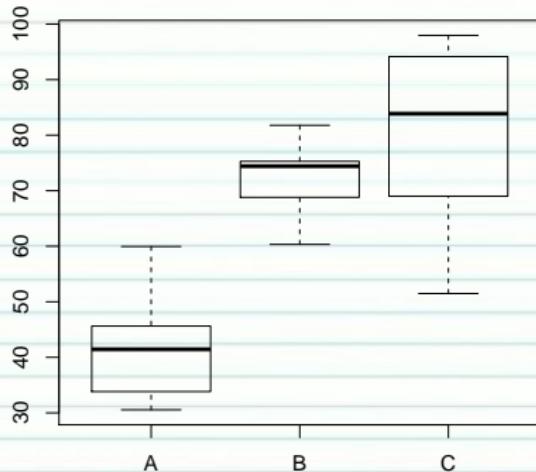

# Nested design

```
> library(ggplot2)
> data.nest$Sites <- factor(data.nest$Sites, levels=paste0('S',1:nSites))
> ggplot(data.nest, aes(y=y, x=1,color=Region)) + geom_boxplot() +
+   facet_grid(.~Sites) +
+   scale_x_continuous('' , breaks=NULL)+theme_classic()
```

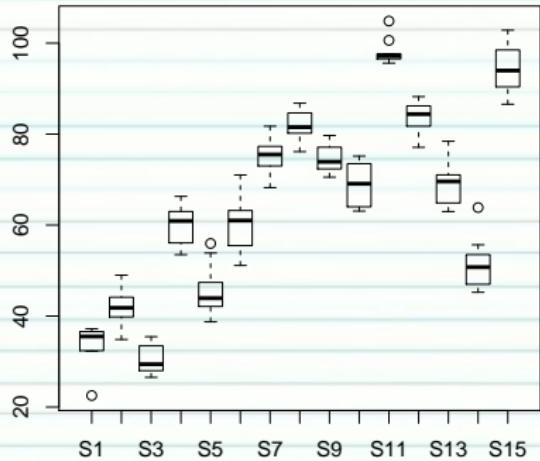

# Nested design

```
> #Effects of treatment  
> library(plyr)  
> boxplot(y~Region, ddply(data.nest, ~Region+Sites,  
+                           numcolwise(mean, na.rm=T)))
```

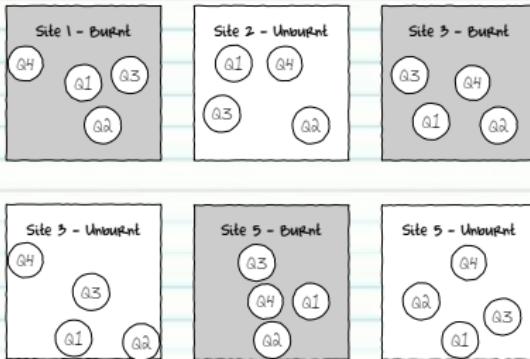

# Nested design

```
> #Site effects  
> boxplot(y~Sites, ddply(data.nest, ~Region+Sites+Quads,  
+                           numcolwise(mean, na.rm=T)))
```

# Nested design

$$y = \mu + \alpha + \beta(\alpha) + \epsilon$$

e.g.

abundance = base + burnt + quadrat(burnt)

# Nested design

$$y = \mu + \alpha + \beta(\alpha) + \epsilon$$

$$y_{ijk} = \mu + \alpha_i \text{Region}_i + \beta_{j(i)} \text{Sites}_{j(i)} + \epsilon_{ijk}$$

$\mu$  - base (mean of first Region)

$\alpha$  - main fixed effect

$\beta$  - sub-replicates (Sites: random effect)

```
> with(data.nest, table(Region,Sites))
```

Sites		S1	S2	S3	S4	S5	S6	S7	S8	S9	S10	S11	S12	S13	S14	S15
Region		A	10	10	10	10	10	0	0	0	0	0	0	0	0	0
	B	B	0	0	0	0	10	10	10	10	10	0	0	0	0	0
	C	C	0	0	0	0	0	0	0	0	0	10	10	10	10	10

```
> head(data.nest, 20)
```

	y	Region	Sites	Quads
1	32.25789	A	S1	1
2	32.40160	A	S1	2
3	37.20174	A	S1	3
4	36.58866	A	S1	4

# Nested design

$$y = \mu + \alpha + \beta(\alpha) + \epsilon$$

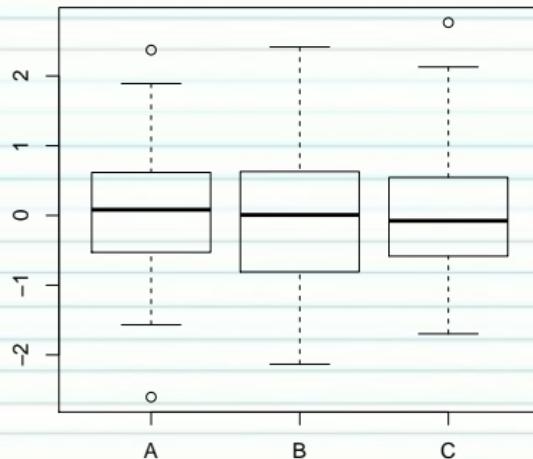

$$y_{ijk} = \mu + \alpha_i \text{Region}_i + \beta_{j(i)} \text{Sites}_{j(i)} + \epsilon_{ijk}$$

```
> library(nlme)
> data.nest.lme <- lme(y~Region, random=~1|Sites, data.nest)
> plot(data.nest.lme)
```

# Nested design

```
> plot(data.nest$Region, residuals(data.nest.lme,  
+ type='normalized'))
```

# Nested design

```
> summary(data.nest.lme)
```

Linear mixed-effects model fit by REML

Data: data.nest

AIC      BIC      logLik

927.7266 942.6788 -458.8633

Random effects:

Formula: ~1 | Sites

(Intercept) Residual

StdDev:      13.6582 4.372252

Fixed effects: y ~ Region

	Value	Std. Error	DF	t-value	p-value
(Intercept)	42.27936	6.139350	135	6.886618	0.0000
RegionB	29.84692	8.682352	12	3.437654	0.0049
RegionC	37.02026	8.682352	12	4.263851	0.0011

Correlation:

(Intr) ReginB

RegionB -0.707

RegionC -0.707 0.500

Standardized Within-Group Residuals:

Min	Q1	Med	Q3	Max
-2.603787242	-0.572951701	0.004953998	0.620914933	2.765601716

(Adjusted p values reported -- single-step method)

# Nested design

```
> library(effects)
> plot(allEffects(data.nest.lme))
```

# Linear mixed effects model

SUMMARY

FIGURE

Step 1. gather model coefficients and model matrix

```
> coefs <- fixef(data.nest.lme)
> coefs
```

	(Intercept)	RegionB	RegionC
	42.27936	29.84692	37.02026

```
> xs <- levels(data.nest$Region)
> Xmat <- model.matrix(~Region, data.frame(Region=xs))
> head(Xmat)
```

	(Intercept)	RegionB	RegionC
1	1	0	0
2	1	1	0
3	1	0	1

# Linear mixed effects model

SUMMARY

FIGURE

Step 3. calculate predicted y and CI

```
> ys <- t(coefs %*% t(Xmat))  
> head(ys)
```

```
[,1]  
1 42.27936  
2 72.12628  
3 79.29961
```

```
> SE <- sqrt(diag(Xmat %*% vcov(data.nest.lme) %*% t(Xmat)))  
> CI <- 2*SE  
> #OR  
> CI <- qt(0.975,length(data.nest$y)-2)*SE  
> data.nest.pred <- data.frame(Region=xs, fit=ys, se=SE,  
+ lower=ys-CI, upper=ys+CI)  
> head(data.nest.pred)
```

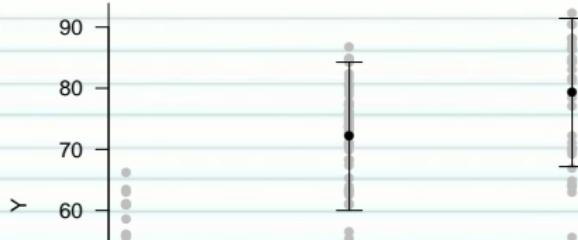

# Linear mixed effects model

SUMMARY

FIGURE

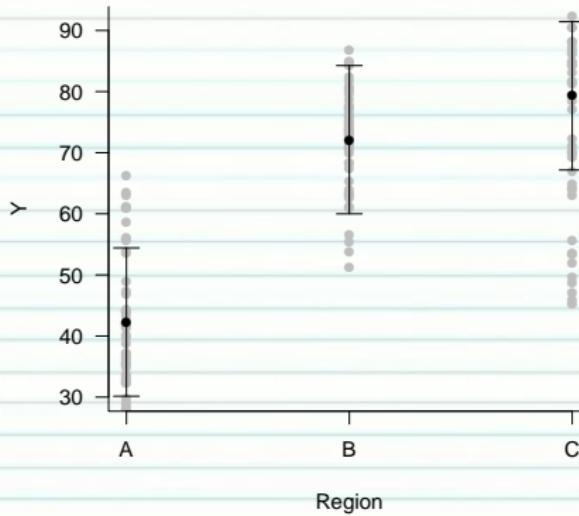

Step 4. plot it

```
> with(data.nest.pred, plot.default(Region, fit, type='n', axes=F, ann=F, ylim=c(55, 95))
> points(y~Region, data=data.nest, pch=16, col='grey')
> points(fit~Region, data=data.nest.pred, pch=16)
> with(data.nest.pred, arrows(as.numeric(Region), lower, as.numeric(Region),
> axis(1, at=1:3, labels=levels(data.nest$Region))
> mtext('Region', 1, line=3)
> axis(2, las=1)
> mtext('Y', 2, line=3)
> box(bty='l')
```

# Linear mixed effects model

SUMMARY      FIGURE

# Linear mixed effects model

SUMMARY

FIGURE

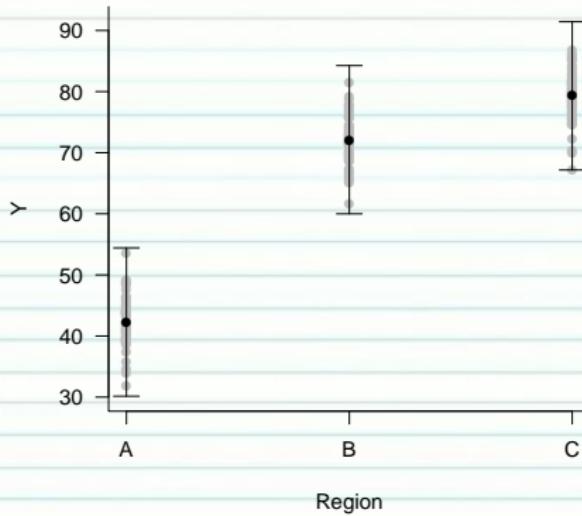

Step 4. plot it

```
> data.nest$res <- predict(data.nest.lme, level=0)-
+     residuals(data.nest.lme)
> with(data.nest.pred, plot.default(Region, fit, type='n', axes=F, ann=F, ylim=
> points(res~Region, data=data.nest, pch=16, col='grey')
> points(fit~Region, data=data.nest.pred, pch=16)
> with(data.nest.pred, arrows(as.numeric(Region), lower,as.numeric(Region),
> axis(1, at=1:3, labels=levels(data.nest$Region))
> mtext('Region', 1, line=3)
> axis(2, las=1)
> mtext('Y', 2, line=3)
> box(bty='l')
```

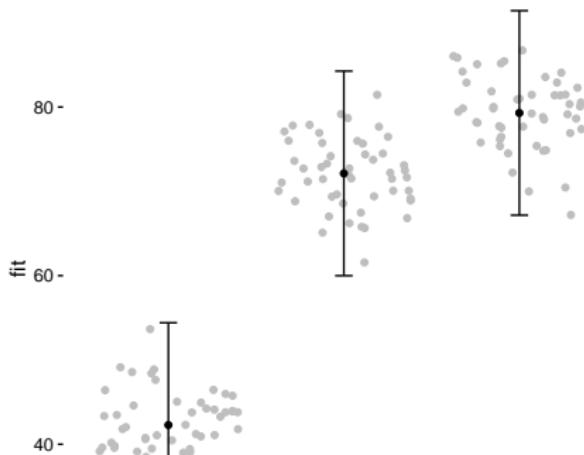

# Linear mixed effects model

SUMMARY      FIGURE

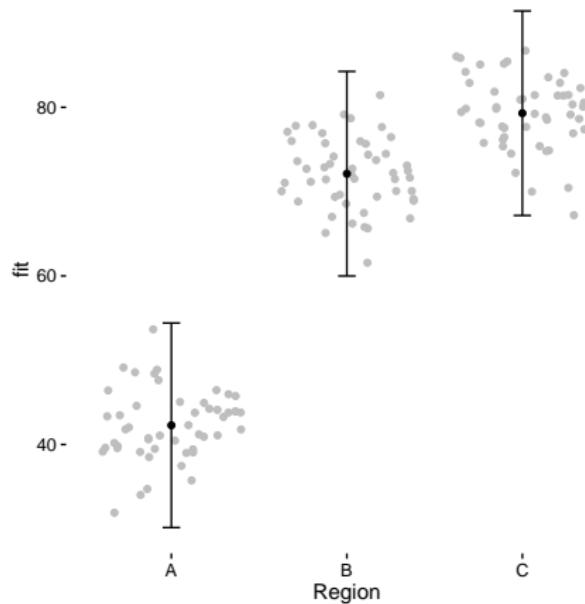

# Linear mixed effects model

```
> library(ggplot2)
> data.nest$res <- predict(data.nest.lme, level=0)-
+   residuals(data.nest.lme)
>
> ggplot(data.nest.pred, aes(y=fit, x=Region))+
+   geom_point(data=data.nest, aes(y=res), col='grey', position = position_dodge(0.9))+
+   geom_errorbar(aes(ymin=lower, ymax=upper), width=0.1)+
+   geom_point()+
